

# Micro Processor & Controller

## Matrix Keyboard & Ext Interrupt

# Delfino EVB External Bus

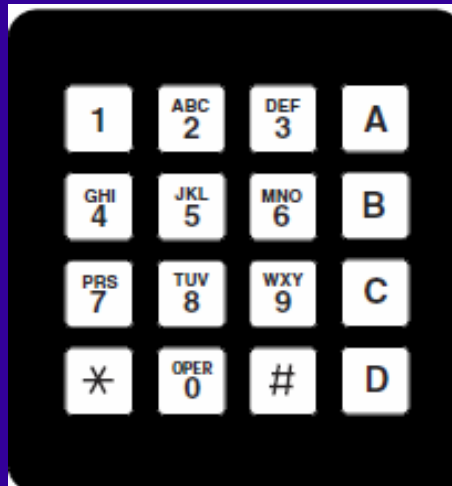

|                  |     |     |
|------------------|-----|-----|
| GPIO40/XA0/XWE1n | 151 | XA0 |
| GPIO41/XA1       | 152 | XA1 |
| GPIO42/XA2       | 153 | XA2 |
| GPIO43/XA3       | 156 | XA3 |
| GPIO44/XA4       | 157 | XA4 |
| GPIO45/XA5       | 158 | XA5 |
| GPIO46/XA6       | 161 | XA6 |
| GPIO47/XA7       | 162 | XA7 |

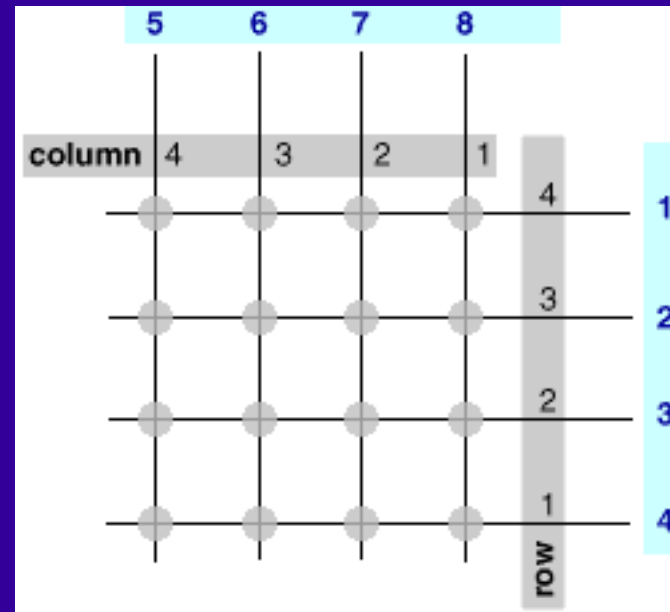

The keyboard connects to the Delfino EVB by External Bus using GPIO40-GPIO47.

# Matrix Keyboard Architecture

- Our keyboard is a passive device.
- The architecture is a 4x4 matrix of 4 column and 4 row.
- The keyboard has a bouncing effect.

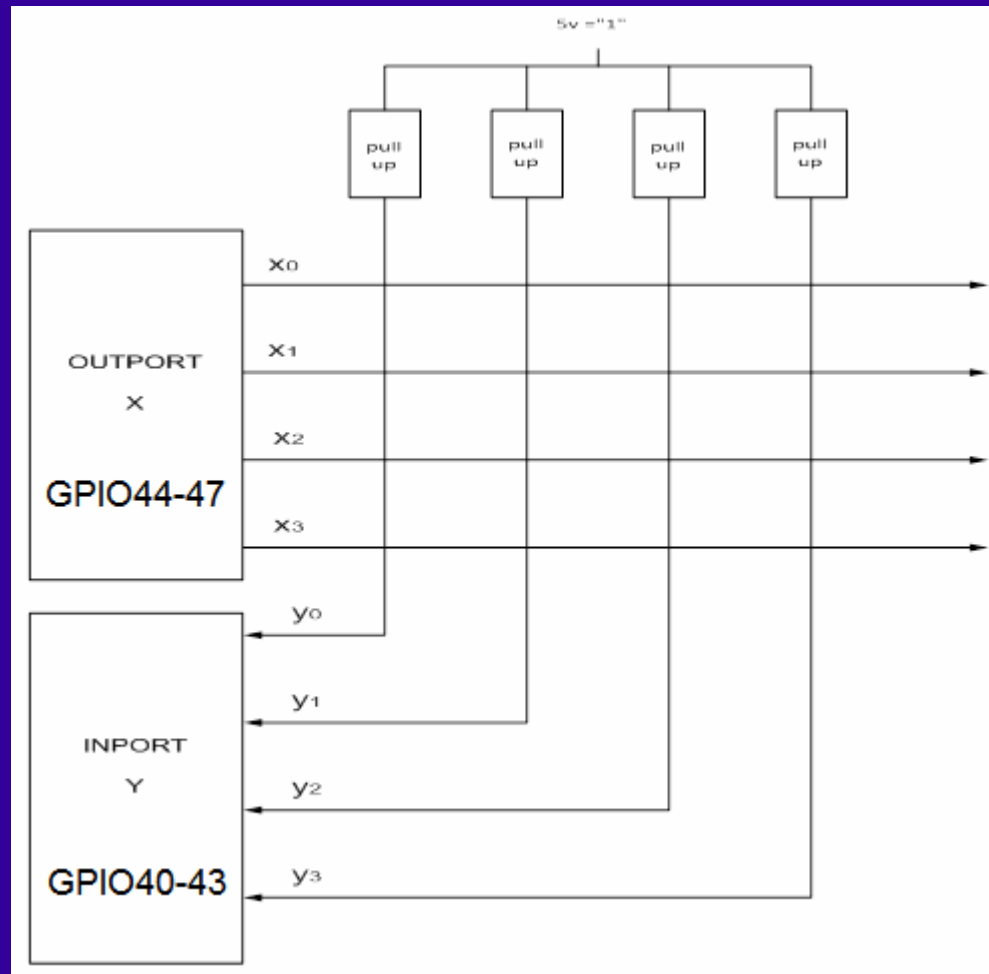

# Matrix Keyboard Architecture

- 4 lines are GPIO outputs.
- 4 lines are GPIO inputs using Pull-up resistors.
- Pressing a button causes shortening between the relevant row and a column.
- The decoding is done by the correlation between the row & column.
- One can use Polling or Interrupt to read the keyboard.

# Matrix Keyboard Connection

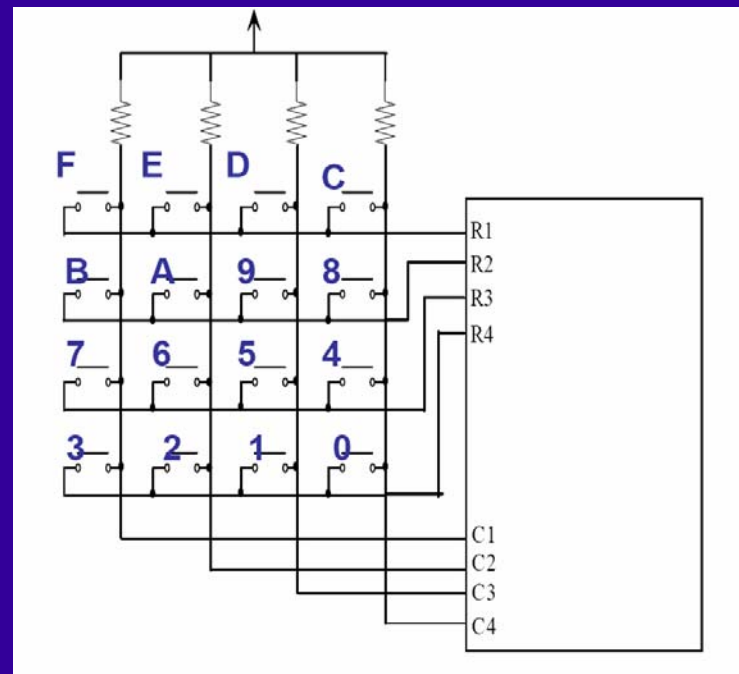

# Scanning Method

|              |   | Upper nibble |   |   |   |   |   |   |   |
|--------------|---|--------------|---|---|---|---|---|---|---|
|              |   | 5            | 6 | 7 | 8 |   |   |   |   |
| Lower nibble | 1 | 1            | 1 | 0 | 1 | 1 | 2 | 3 | A |
|              | 2 | 0            | 0 | 0 | 0 | 4 | 5 | 6 | B |
|              | 3 | 1            | 1 | 0 | 1 | 7 | 8 | 9 | C |
|              | 4 | 1            | 1 | 0 | 1 | * | 0 | # | D |

# Scanning Procedure

- Place 0 on  $R_K$  bit.
- Wait on end of bouncing.
- Read C port (MyNib).
- If (MyNib  $\neq$  0xF) then the button has been pressed.
- Build key-code.
- Otherwise, try next row.
- Repeat constantly.

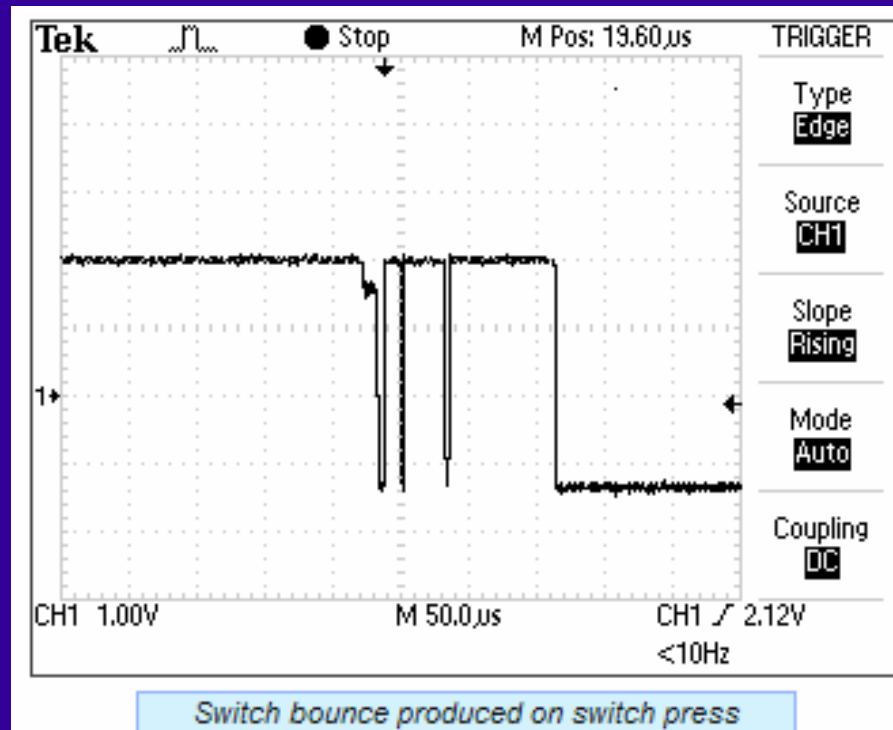

# Contact Bouncing Effect

When a switch is actuated and contacts touch one another under the force of actuation, they are supposed to establish continuity in a single, crisp moment. Unfortunately, though, switches do not exactly achieve this goal. Due to the mass of the moving contact and any elasticity inherent in the mechanism and/or contact materials, contacts will “bounce” upon closure for a period of milliseconds before coming to a full rest and providing unbroken contact.

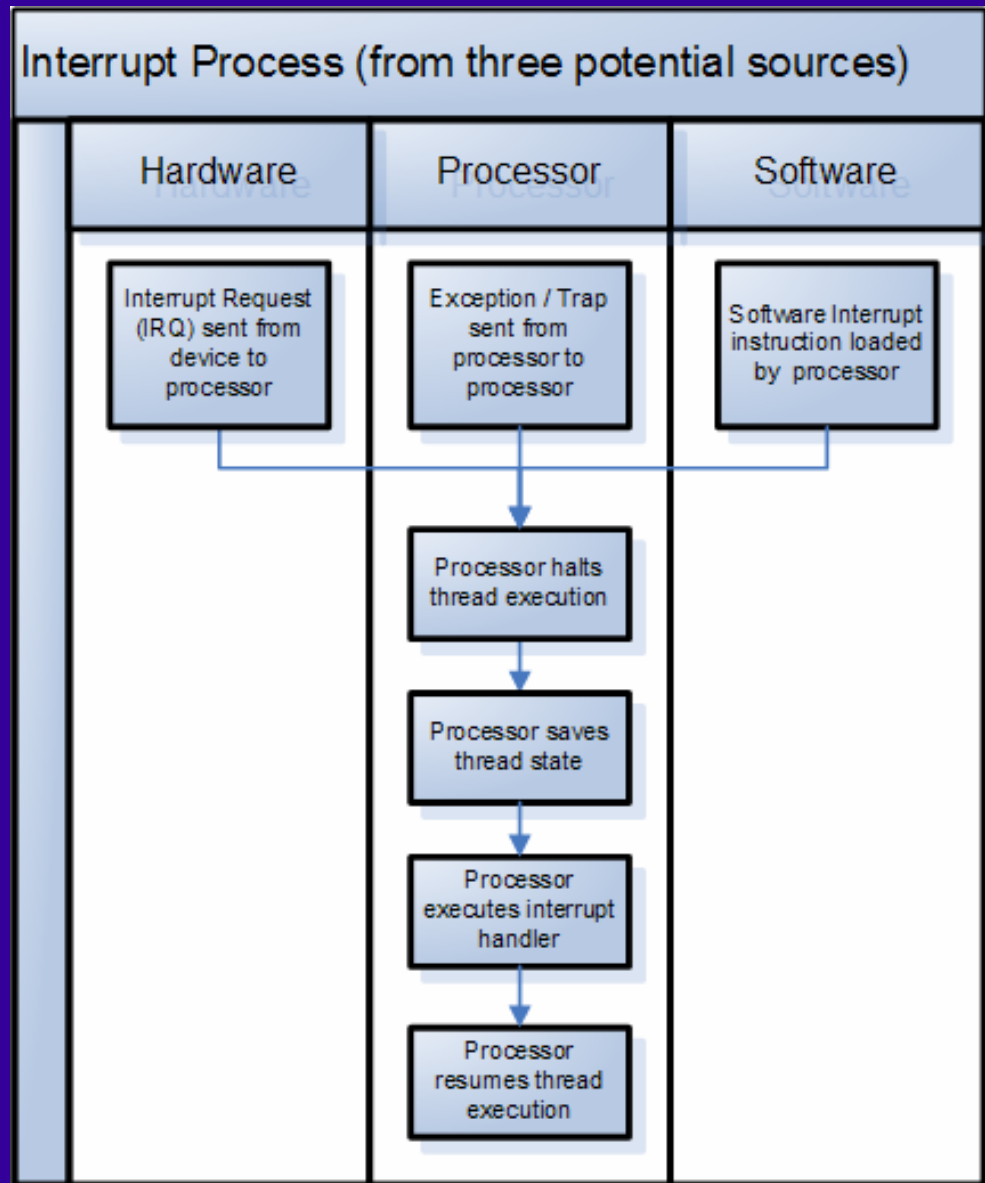

if the switch is used to send a signal to an electronic amplifier or some other circuit with a fast response time, contact bounce may produce very noticeable and undesired effects

# Contact Bouncing Effect

- Effect that we find in mechanical switching devices.
- At switching time there has a bouncing in order of milliseconds.
- One must use an analog or digital filter to eliminate the effect.

# Interrupt - Source

# Scanning Code

```
char ReadKB(char wait)
{
static char code[] = {0xE, 0xD, 0xB, 0x7};
char data;
char i;
    KeyboardWriteCode(0x0);
    DELAY_US(1000);
    while(KeyboardReadCode() == 0x0F) // Check 4 data bits GPIO44-GPIO47
        if (!wait) return(0);
    Beep(20);
    for(i=0; i<4; i++)
    {
        KeyboardWriteCode(code[i]);
        DELAY_US(1000);
        data = KeyboardReadCode();
        if (data != 0x0F)
            break;
    }
    while(KeyboardReadCode() != 0x0F); // Wait for button release
    DELAY_US(1000);
    KeyboardWriteCode(0x0);
    return(scan2ascii((data << 4) | i));
}
```
